

# **Graphics engines and their APIs**

**Code packages with a well-defined interface**

**2D or 3D**

**2D: Usually pixel-graded coordinates**

**3D: Normalized coordinates, world-graded  
coordinated, scalable**

Information Coding / Computer Graphics, ISY, LiTH

## **Features in a 2D API**

**Examples from two commercial 2D API's:**

**GDI (Graphics Device Interface)  
(Microsoft, MS Windows)**

**QuickDraw  
(Apple, MacOS)**

Information Coding / Computer Graphics, ISY, LiTH

## **Graphics environments**

**Information about pens, colors, clipping etc.**

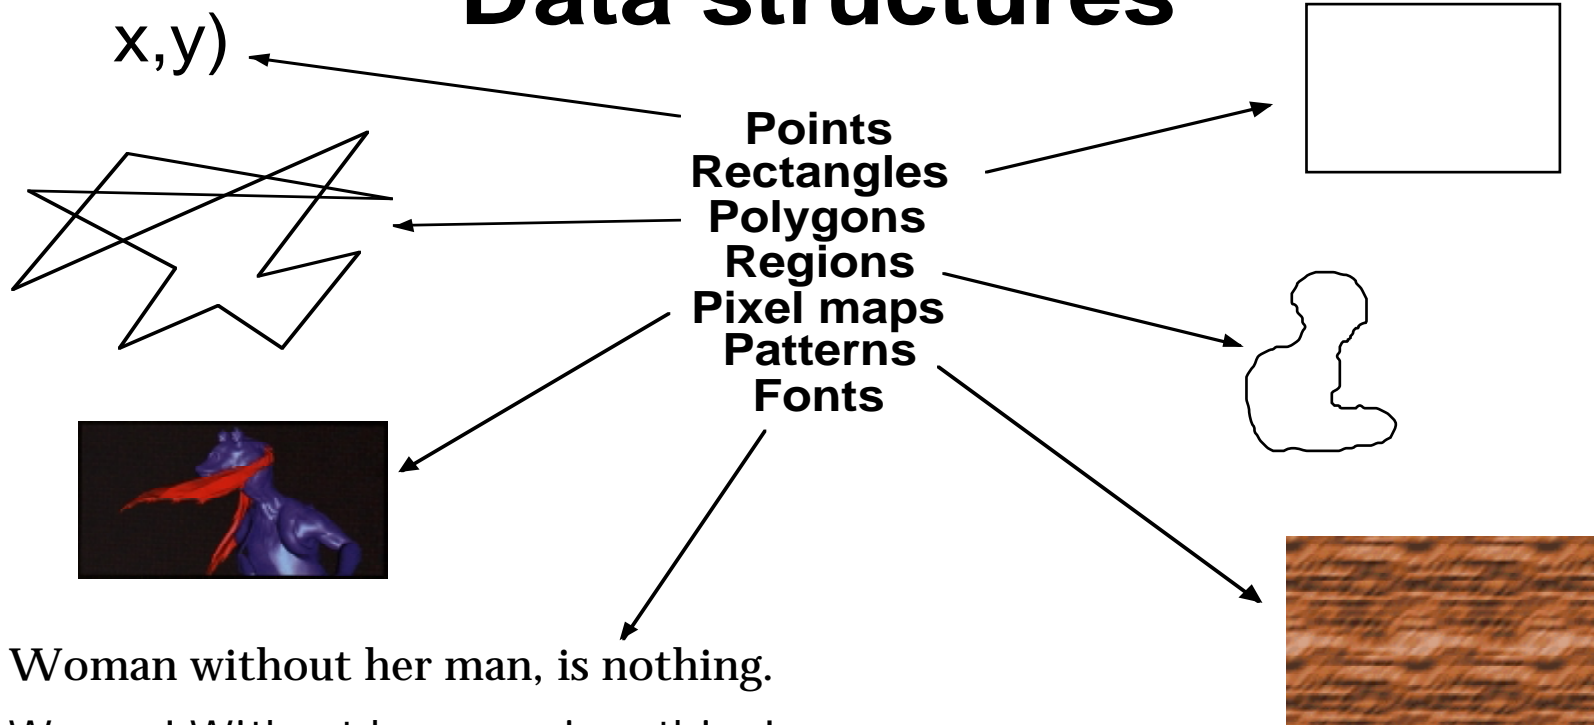

**GDI:  
Drawing Context (DC)**

**QuickDraw:  
GrafPort**

**OpenGL:  
The OpenGL current context**

# Data structures

**nformation Coding / Computer Graphics, ISY, LiTH**

## **Drawing operations**

**raw points, lines, rectangles, ovals, rounded-corner rectangles, polygons, regions.**

**Drawing variants applicable on one shape:  
frame, paint, fill, invert, erase**

**Draw text.**

**Bit blitting.**

**nformation Coding / Computer Graphics, ISY, LiTH**

# **Metafiles**

**A metafile is a sequence of recorded drawing commands. Not necessarily a disk file.**

**WMF, EMF, PICT, EPS.**

**WMF = Windows Metafile**

**EMF = Enhanced Metafile**

**PICT = Macintosh Picture**

**EPS = Encapsulated Postscript**

**In OpenGL: Display lists**

Information Coding / Computer Graphics, ISY, LiTH

## **2D versus 3D**

**2D: Points, lines, text**

**3D: Polygons, surfaces, camera**

**2D has more different primitives**

**3D builds everything from polygons**

Information Coding / Computer Graphics, ISY, LiTH

## **Features in a 3D API**

**Geometrical:**

**Polygons (triangles)**

**(Points and lines exist but are rarely used.)**

**Rendering:**

**Light sources, Textures, Shading**

**Camera specification**

**Information Coding / Computer Graphics, ISY, LiTH**

# **OpenGL**

**Portability: Excellent!**

**Performance: Good**

**Source: Yes, at least through Mesa**

**Language: Any**

**Fairy low-level, add scene graphs etc on top**

Information Coding / Computer Graphics, ISY, LiTH

# **Direct3D**

**Portability: Poor**

**Performance: Good**

**Source: No**

**Language: Any**

**Includes many utilities**

Information Coding / Computer Graphics, ISY, LiTH

# Java3D

**Portability: Good!**

**Performance: So-so**

**Source: No**

**Language: Java only**

**High-level, scene graph mandatory**

Information Coding / Computer Graphics, ISY, LiTH

**Do you need extreme low level graphics programming these days?**

**Mobile phones**

**Special-purpose systems**

**Other future low-power devices**

**OpenGL ES helps on mobile systems**

Information Coding / Computer Graphics, ISY, LiTH

## **The new low level: Shader programming**

**Modern GPUs support “shader programs”, short programs executed on the GPU. They allow more freedom in shading and texturing.**

**You will write your own in lab 3!**

## Shader programming example: Texture generated in real time, Mandelbrot fractal

Can't be done in real time on this computer,  
but I will bring one that can
