### **Spin Effect**

**Golf Game Version 4**

A tilt in the spin axis causes the ball to curve

**…Java\_Code\Chapter05\_Projectile\GolfGame4.java (htps://ae.onliu.se/tsbk03)**

### **Spin Effect**

#### **Summary:**

- o An object given backspin will generate a lifting force. An object given topspin will generate a force that will push the object downwards.
- o The acceleration that results from Magnus force is inversely proportional to mass. A heavier object will experience less acceleration than a similar, lighter object.
- o The magnitude of Magnus force depends on the geometry. All other things being equal, larger objects will generate a larger Magnus force than will smaller objects.

#### **Results:**

- 1) Gravity only Vx=28m/s
- 2) Aeroresitance Vx=62 m/s
- 3) Wind  $+10m/s$  Vx=46m/s -10m/s Vx=86m/s
- 4) Spin, Magnus force up Wind +10m/s Vx=36m/s -10m/s Vx=72m/s Spin, Magnus forse down Wind +10m/s Vx=87m/s -10m/s Vx=145m/s

### **Linear momentum and impulse**

The linear momentum

 $\vec{p}$  =  $m \vec{v}$ 

Newton's 2nd law

$$
\vec{F} = \frac{d\vec{P}}{dt}
$$

**Conservation of Linear Momentum** 

$$
\sum_i \vec{P}_i = const
$$

### **Elastic Collisions**

A perfectly elastic collision is defined as one in which there is no loss of kinetic energy in the collision.

An inelastic collision is one in which part of the kinetic energy is changed to some other form of energy in the collision

Before the collision

After the collision

![](_page_31_Picture_1.jpeg)

#### **Summary**

- $\Box$  The change in velocity that results from a collision can be characterized by a linear or angular impulse.
- $\Box$  The post-collision velocities of two objects after a collision can be determined from the principle of conservation of momentum and the coefficient of restitution for the collision.
- $\Box$  For frictionless collisions, only the velocity in the direction of the line of action of a collision is affected by the collision. The other velocity components normal to the line of action are unchanged.
- $\Box$  For collisions that involve friction, the resulting frictional impulse reduces the magnitude of the velocity in the direction normal to the line of action and causes the objects to spin.

#### **Summary**

- When a ball (or person for that matter) is in the air, it can be treated as projectile and will be subject to the forces due to gravity, aerodynamic drag, wind, and spin.
- The Magnus force due to spin is very important for the sports of golf, soccer, and baseball. The magnitude of the force due to spin can be obtained by determining the lift coefficient for the object in question.
- $\Box$  At times the effects of wind and spin can be ignored, for example, when simulating the flight of a basketball.
- $\Box$  There are also instances, for example soccer and baseball, when it is probably better for game programming purposes not to try to model the initial collision, but rather to begin the simulation by specifying the post-collision velocity, spin rate, and spin axis of the ball.
