

Information Coding / Computer Graphics, ISY, LiTH

Lecture 3 (lesson 3 in original plan)

More CUDA

In this episode...

- **Query device capabilities**
 - **CUDA events**
- **More on CUDA memory:**

Coalescing, Constant memory, Texture memory...

The story so far...

- **CUDA and its language extensions**
 - **The CUDA architecture**
 - **Intro to memory**
- **Matrix multiplication example, using shared memory**

CUDA and its language extensions

Kernel invocation `myKernel<<<>>>()`

`__global__ __device__ __host__`

`cudaMalloc(), cudaMemcpy()`

`threadIdx, blockIdx, blockDim, gridDim`

Using `nvcc`

Information Coding / Computer Graphics, ISY, LiTH

The CUDA architecture

Blocks and threads

Grid-block-thread hierarchy

Indexing data with thread/block numbers

Intro to memory

global memory

shared memory

constant memory

local memory

texture memory/texture units

Matrix multiplication example, using shared memory

Huge speedup - my measly 9400M went from obvious loser to clearly faster than CPU!

Information Coding / Computer Graphics, ISY, LiTH

Over to today's episode:

Lecture questions:

1. Why can using constant memory improve performance?
2. What is CUDA Events used for?
3. What does coalescing mean and what should we do to get a speedup from coalescing?

Information Coding / Computer Graphics, ISY, LiTH

CUDA and graphics

Simplest way: Pass output from CUDA to an OpenGL texture.

Example: Julia set.

Good for visualizing results. Better methods exist, without having to move data to CPU and back.

Self-squaring fractals, the Julia set

$$z_{k+1} = z_k^2 + \lambda$$

Julia set for
 $\lambda = (0, 1) = 0 + j$

**Start with position in
complex space.**

**Apply complex function
recursively**

Inspect distance to origin

**Perfectly parallel
algorithm**

Query devices

You can't trust all devices to have the same - or even similar - data.

New boards may have totally different data.

Query CUDA for a list of features using `cudaGetDeviceProperties()`

Example query result

```
----- Information for GeForce 9400M -----  
    Compute capability:  1.1  
    Total global memory/VRAM:  259712 kB  
    Total constant Mem:  64 kB  
    Number of thread processors (mp):  2  
    Shared mem per mp:  16 kB  
    Registers per mp:  8192  
    Threads in warp:  32  
    Max threads per block:  512  
    Max thread dimensions:  (512, 512, 64)  
    Max grid dimensions:  (65535, 65535, 1)
```

What is important?

Compute capability - can this board at all work with our program?

Amount of shared memory - make sure we fit.

Max threads, max dimensions - make sure we fit.

Threads in warp: A lower bound for performance.

Number of thread processors: Lower bound for blocks

Information Coding / Computer Graphics, ISY, LiTH

Compute capability

Essentially CUDA/architecture version number.

- 1.0: Original release.
- 1.1: Mapped memory, atomic operations.
- 1.3: Double support.
- 2.0: Fermi.

Information Coding / Computer Graphics, ISY, LiTH

Do I care about Compute capability?

While learning CUDA - not much. Stick to the basics, it works on all.

But if you write professional CUDA code, of course.

CUDA Events

Timing!

Two ways of timing CUDA programs:

- **CPU timer. Synchronize at start and end.**
- **CUDA Events. Synchronize at end.**

Synchronize? Because CUDA runs asynchronously.

CUDA Events API

cudaEventCreate - initialize an event variable

cudaEventRecord - place a marker in the queue

cudaEventSynchronize - wait until all markers
have received values

cudaEventElapsedTime - get the time difference
between two events

Information Coding / Computer Graphics, ISY, LiTH

CUDA memory

Coalescing

Constant memory

Texture memory

Pinned memory

CUDA memory

We already know...

- Global memory is slow.
- Shared memory is fast and can be used as "manual cache"
- There were some other kinds of memory...

Coalescing

Always access global memory "in order"

If threads access global memory in order of thread numbers, performance will be improved!

Good!

Bad!

WTF?

How can performance depend on what order I access my data??? Isn't it "random access"?

Yes... You can access in any order you want, but ordered access *helps* the GPU to read more data in one access!

Why? Because the GPU bus is wider than your data!

Coalescing

Example: Assume that the data below is 1/4 of the bus width.

Good!

Bad!

Information Coding / Computer Graphics, ISY, LiTH

Coalescing on Fermi

Effect reduced by caches - but not removed.

Coalescing is still needed for maximum performance.

Information Coding / Computer Graphics, ISY, LiTH

Accelerating by coalescing

Pure memory transfers can be 10x faster by taking advantage of memory coalescing!

Example: Matrix transpose

No computations!

Only memory accesses.

Matrix transpose

Naive implementation

```
__global__ void transpose_naive(float *odata, float* idata, int width, int height)
{
    unsigned int xIndex = blockDim.x * blockIdx.x + threadIdx.x;
    unsigned int yIndex = blockDim.y * blockIdx.y + threadIdx.y;

    if (xIndex < width && yIndex < height)
    {
        unsigned int index_in = xIndex + width * yIndex;
        unsigned int index_out = yIndex + height * xIndex;
        odata[index_out] = idata[index_in];
    }
}
```

How can this be bad?

Matrix transpose

Coalescing problems

**Row-by-row and column-by-column.
Column accesses non-coalesced!**

Matrix transpose

Coalescing solution

**Read from global memory
to shared memory**

**In order from global, any
order to shared**

Write to global memory

**In order write to global,
any order from shared**

Better CUDA matrix transpose kernel

```
__global__ void transpose(float *odata, float *idata, int width, int height)
{
    __shared__ float block[BLOCK_DIM][BLOCK_DIM+1];

    // read the matrix tile into shared memory
    unsigned int xIndex = blockIdx.x * BLOCK_DIM + threadIdx.x;
    unsigned int yIndex = blockIdx.y * BLOCK_DIM + threadIdx.y;
    if((xIndex < width) && (yIndex < height))
    {
        unsigned int index_in = yIndex * width + xIndex;
        block[threadIdx.y][threadIdx.x] = idata[index_in];
    }

    __syncthreads();

    // write the transposed matrix tile to global memory
    xIndex = blockIdx.y * BLOCK_DIM + threadIdx.x;
    yIndex = blockIdx.x * BLOCK_DIM + threadIdx.y;
    if((xIndex < height) && (yIndex < width))
    {
        unsigned int index_out = yIndex * height + xIndex;
        odata[index_out] = block[threadIdx.x][threadIdx.y];
    }
}
```

Shared memory for temporary storage

Read data to temporary buffer

Write data to tglobal memory

Coalescing rules of thumb

- **The data block should start on a multiple of 64**
- **It should be accessed in order (by thread number)**
- **It is allowed to have threads skipping their item**
 - **Data should be in blocks of 4, 8 or 16 bytes**

Information Coding / Computer Graphics, ISY, LiTH

Constant memory

Sounds boring... but has its uses.

Read-only (for kernels)

`__constant__` modifier

Use for input data, obviously

Benefits of constant memory

- **No cudaMemcpy needed! Just use it from kernel, write from CPU!**
- **For data read by all threads, significantly faster than global memory!**
 - **Read-only memory is easy to cache.**

Why faster access? When?

All threads reading the same data.

One read can be broadcast to all "nearby" threads.

Nearby? All threads in same "half-warp" (16 threads in most pre-Fermi architectures)

But no help if threads are reading different data!

Information Coding / Computer Graphics, ISY, LiTH

Example of using constant memory: Ray-caster

Demo from "CUDA by example"

With and without using `__const__`

Ray-caster example

Every thread renders one pixel

Loop through all spheres, find closest with intersection

Write result to an image buffer.

Image buffer displayed with OpenGL.

Non-const: Uploads sphere array by `cudaMemcpy()`

Const: Declares array `__const__`, uses directly from kernel.
(Slightly simpler code!)

Ray-caster example

Resulting time:

Without using const: 70.2 ms

With const: 41.9 ms

**Significant difference - for something that
simplified the code!**

Constant memory conclusions

Relatively fast memory - for the case when all threads read the same memory!

Some advantage for code complexity.

NOT something we use for everything.

Texture memory/ Texture units

**Texture memory, yet another kind of memory (or
memory access method)**

But didn't we hide the graphics heritage...?

**Access global memory through the texturing units.
Let's CUDA take advantage of the strong points
with texturing units.**

Texture memory

Read-only.

Cached! Can be fast if data access patterns are good.

Texture filtering, linear interpolation.

Especially good for handling 4 floats at a time (float4).

`cudaBindTextureToArray()` binds data to a texture unit.

Texture memory for graphics

Texture data mostly for rendering textures

One texel used by 4 neighbor pixels

One pixel usually 4 bytes - more than one pixel can be read on one read.

Designed for *spatial locality*

Varying access patterns - but neighbors are still neighbors!

Information Coding / Computer Graphics, ISY, LiTH

Spatial locality for other things than textures

Image filters of local nature

Physics simulations with local updates, transfer of heat, liquids, pressure...

Big jumps, no gain!

Using texture memory in CUDA

Allocate with cudaMalloc

Bind to texture unit using cudaBindTexture2D()

Read from data using tex2D()

Drawback: Just like in OpenGL, messy to keep track of which texture unit/texture reference is which data.

Interpolation

Computation tricks when optimizing

Texture access provides hardware accelerated linear interpolation!

Access texture data on non-integer coordinates and the texture hardware will do linear interpolation automatically!

Can be used for many calculations, e.g. filters.

Interpolation

Texture accesses and calculations hardware accelerated!

Hardware interpolation too good to be true...

The interpolation trick sounds kind of useful (for some cases)... but isn't as useful as it seems.

Why? It is ment for interpolating between texels, visually. Small errors is not a problem then! May have low precision, like 10 steps.

Not as fun then...

Information Coding / Computer Graphics, ISY, LiTH

Demo using texture memory

Heat transfer demo

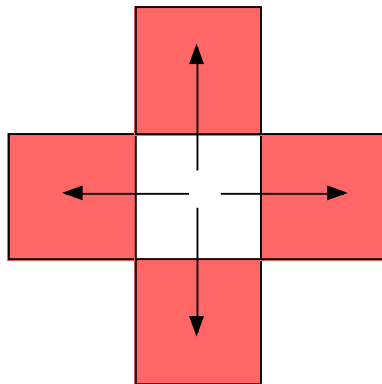

Information Coding / Computer Graphics, ISY, LiTH

Demo using texture memory

Heat transfer demo

Makes local operations modelling heat dissipation

Seriously... pretty slow. I could beat this with pure OpenGL any time. Why?

Information Coding / Computer Graphics, ISY, LiTH

That's all folks!

Next: Computing with shaders.
